Fraud Operations | Case FRD-01

Ihab Diab | Independent simulated learning project | Synthetic data only

Fictional event timeline

09:02 — successful login from an unrecognized device. 09:07 — password reset. 09:11 — beneficiary added. 09:16 — $2,800 outbound transfer instruction. All times and amounts are invented for practice.

Observed risk signals

The quick sequence of device change, credential reset, new beneficiary, and transfer instruction merits verification. It does not prove that an attacker controlled the account.

Review approach

Check device recognition, historical customer behavior, session logs, step-up authentication events, and customer confirmation through an established secure channel. Avoid disclosing sensitive information during validation.

Decision — simulated

Escalate to fraud operations for urgent validation and apply institution-specific controls only if authorized by policy. Document the timeline and data provenance; no actual account was accessed or frozen.

Disclosure: This document is a fictional training exercise. No real customers, sanctioned parties, bank systems, regulatory filings, or professional AML investigations were involved.
